

Hotel Management System Project Proposal

Introduction

The Hotel Management System Project is proposed to give solutions to the major problems faced by various hotel management. This proposal for the hotel management system project has a collection of reasons why it should be developed and implemented. It includes a brief introduction of the project, problem statement, solution, and scope.

Problem Statement: Traditional hotel management does not include all functions, such as the location of the consumer, the amount of payment for the reservation, and what they are doing right now. The hotel is experiencing a number of issues that are affecting the hotel's reliability, performance, efficiency, and effectiveness in day-to-day operations.

The following are some of the significant issues:

Customers' reservations are inefficient.

They are unable to promote the services that they desire.

Hotel information is inaccessible.

Data insertion and retrieval are tough.

Report generation is challenging.

Information delays in the collection and processing of client data.

Solution: To address the aforementioned issues, creating a computerized hotel management system is proposed to effectively and efficiently manage hotel service. The Hotel Management System project can maintain and manage the various hotel tasks and processes. It is primarily responsible for hotel management in the database's core section. The system gives information on the various hotels that are available, as well as their current availability status. Guests can come to the website and register with the system by providing the required information.

Project Scope: The Hotel Management System software automates major hotel processes like COD generation, billing, and keeping track of daily transaction data. The database can be controlled and modified by the admin.
