

INVENTORY MANAGEMENT SYSTEM DEPLOYMENT DIAGRAM PDF

Inventory Management System Deployment Diagram Description

Deployment diagrams demonstrate how software and hardware communicate to ensure appropriate inventory management system operation. It properly explains how software interacts with hardware. They also help figure out which a certain type of hardware uses software parts.

According to Guru99.com, the main aim of deployment diagrams is to describe how software is delivered into the hardware system. It depicts how software interacts with hardware to perform all of the functions. It's a term that describes how software interacts with hardware and vice versa.

Deployment Diagram for Inventory Management System in UML

A deployment diagram for Inventory Management System in UML is used to illustrate its' physical architecture. In UML, deployment diagrams can show you how the software and hardware of the inventory system work together and where the processing takes place.

The inventory management system uses a UML deployment diagram to show how should the developed software be deployed. It clarifies the communications between links(nodes) which helps the project to work according to the design given to it. Deployment diagrams depict the setup of run-time processing nodes and the components that reside on them.

Additional Knowledge

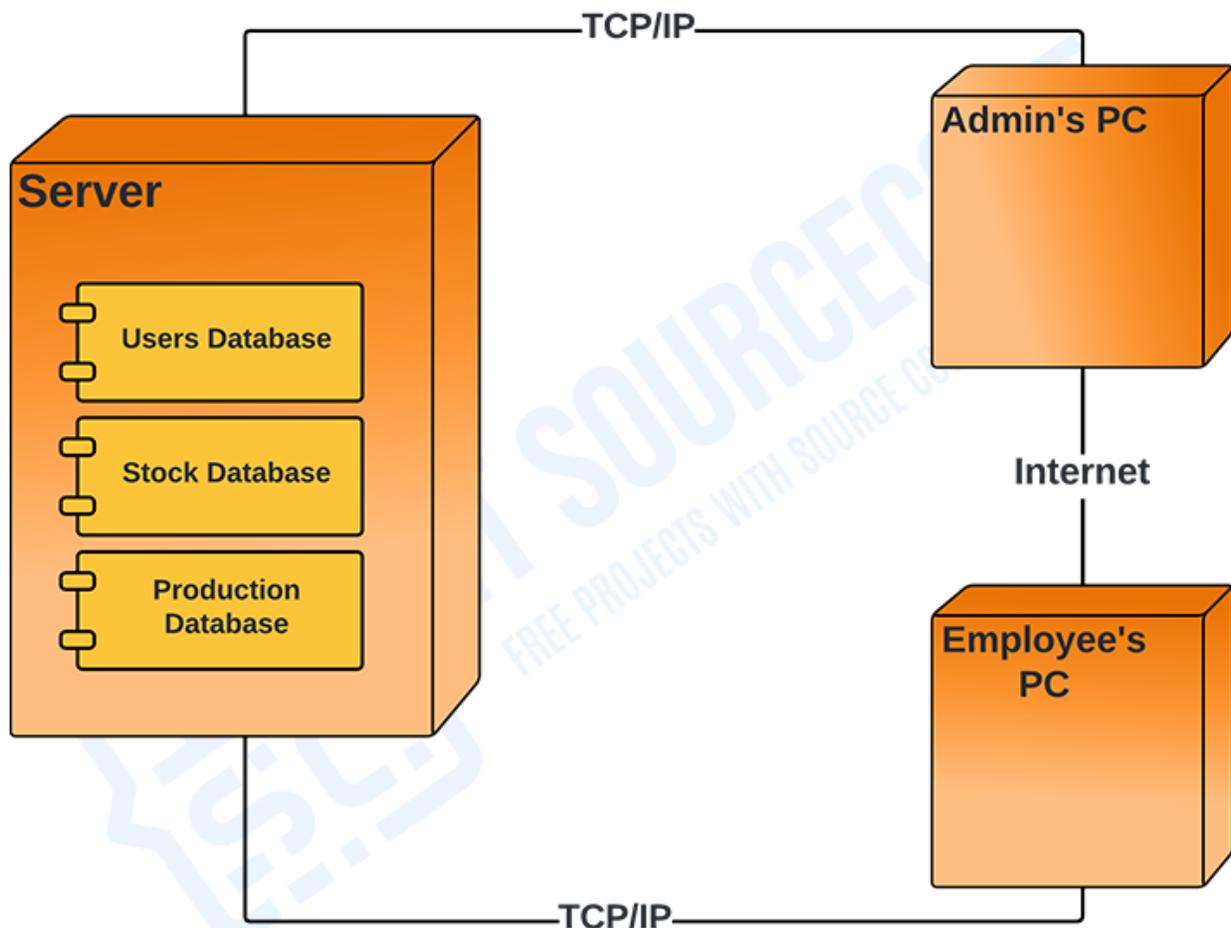

The topology of the physical components of a system, where the software components are installed, is visualized using deployment diagrams. Deployment diagrams are used to depict a system's static deployment view. Nodes and their relationships are depicted in deployment diagrams.

The Deployment Model shows how components will be distributed across the system architecture in detail. It contains information about network capabilities, server specifications, hardware requirements, and other aspects of the planned system's deployment.

Deployment Diagram for Inventory Management System

Here's the Deployment Diagram for Inventory Management System. It shows a detailed illustration of the system's software and hardware specification. Additionally, it gives you the complete physical structure of the inventory management system that is needed in its deployment for its users.

INVENTORY MANAGEMENT SYSTEM

DEPLOYMENT DIAGRAM

Deployment Diagram of Inventory Management System in UML

It is important to create the deployment diagram to clarify the needs of the project before it will put into operation. This will help you avoid unnecessary difficulties that may encounter because of specification deficiency.

Inventory Management System UML Deployment Diagram (Explanation)

The inventory management system UML deployment diagram explains the sketch of the relationship between software and hardware. These hardware and software are labeled to clarify their part to the system's operation. They were represented by nodes and the connections were represented by labeled arrows.

The deployment diagram shows the scenario when the system is deployed. It has 3 nodes represented with boxes and relationship connections. The nodes are the admin's PC, the employee's PC, and the server. The server contains several components (databases) such as **users**, **stocks**, and **production**.

For the connection, the server is connected to the PCs using TCP/IP which enables it to pass data to the devices and will be accessed by the users. The users then can communicate using the internet connection.
